They say that the exact foundation of start of the Universe or as this paper will refer to it as potentially Universe One, that man has physically been to (in the form of work built by man, not man physically complexion either male/female but rather as technology “to”, where to equals the distance traveled) is roughly 16 Billion Miles away, and we know or estimate the Big Bang to have been Billions of years from current time. These time terms may be called light years or seconds or another form of measurement.

(also known as; after the Big Bang) but this paper will and is focusing on the Universe known as The Universe Two. Some may ask why not The Universe Zero and The Universe One. Well,it is already a complicated complexity that humans may not be able to fathom as well.

#Numerical location of The Universe Two and further theories, ideas, explanation or explanations.

Location: 1X past <~> where <~> is the exact point past The Universe One. Measurement of 1 is equal to closet measure of unit.

1X<~> = The Universe Two
